Hussain Tahir	A00072619

Application Idea

An Event Ticket Booking System which will allow event organizers to create and run events while allowing the customers to browse, search, and purchase tickets to different events like concerts, conferences, sports matches, and workshops.

Purpose of the Application

The application is a connecting tool between organizers and the attendees of the event. It simplifies the process of ticket sales and attendance tracking of events, taking away manual processes and offering real-time inventory management. It is a CRUD application that will effectively address the events, users, tickets, and bookings with the help of a database-driven interface.

Business Questions

The following important business questions will be answered in the application:

- Which events are being booked currently and their status with regard to ticket availability?
- What has been the number of tickets sold on each event and the amount of revenue generated?
- What events are highly popular in terms of the rates of booking and interest of the customers?
- What is the overall booking history of a customer?
- What are the ways of tracking and managing events as well as updating event information and capacity by the organizers?

User Personas

Persona 1: Sarah David - Organizer of events.

Background: Sarah is a 32-year-old event coordinator of a middle-sized entertainment firm. She deals with 15-20 events monthly of either music concerts or corporate workshops.

Objectives: To design and operate various events efficiently, to monitor the sale of tickets in real-time and to update information about an event fast when any changes are made.

Frustrations: Having to do ticket sale tracking across spread sheets, inabilities to update event details on various platforms as well as lack of real time access on the booking status.

Needs: The ability to develop events, track sales, handle capacity and produce event performance reports centrally.

Persona 2: Ali Hussain - Attendee at an event.

Background: Ali is a 28-year-old software developer with a hobby of going to concerts, technology conferences, and sports events during his leisure time. He goes on three or two trips per month.

Goals: To simply find out what is on and to book the tickets in a hurry and see his booking history to organize his time.

Frustrations: Not being able to access events in one place, struggling with various checkouts to the websites, and not being aware that the tickets are already booked in different platforms.

Needs: The interface should be easy to navigate events by category, filter individual events, buy tickets in a way that is simple and see all his bookings in a single location.

Design Materials

Problem Statement

The organizers of the event have a hard time managing tickets sales and information of the event effectively and the customers have a hard time locating and purchasing the tickets in the incompatible platforms, leading to missed sales experiences and bad user experience.

How Might We Questions

- What can we do to make the process of creating an event as easy as possible by the organizer and still record all the information that is required?
- How could we ensure that the customers make it easy to find events that suit them?
- What could we do to give real-time information on the availability of tickets to avoid overbooking?
- How can we empower the customers to easily book and check their history of tickets?

Task Board and GitHub Repository

Task Board URL: <https://github.com/users/nanichowdary55/projects/1/views/1>

GitHub Repository: All team GitHub

Initial Tasks Identified

- Create a GitHub repository with proper structure and README
- Initialize Node.js project with Express.js framework
- Design the MySQL database schema for events, users, tickets, and bookings
- Create initial PUG templates for main pages
- Develop user stories for Sprint 2
- Set up Docker configuration for deployment
- Create wireframes for key user interfaces

- **Team Code of Conduct:**

Event Ticket Booking System Project

Introduction

This Code of Conduct creates the expectations and duties of our team and the resolving conflict process. Everyone on the team will ensure that they keep the standards throughout the project life cycle.

Team Commitments

- Communication
- Respond within 24 hours to team messages on a working day.
- Turn up to all the planned team meetings or give prior notice in case of inability to attend.
- Keep the team informed of any blockers or delays likely to occur.
- Always use professional and polite language towards all the team interactions.
- Communicate to everyone on the team about major decisions or changes.

Quality of Work and Contribution

- Accomplish all the assigned tasks within the agreed deadlines.
- Create work of the quality that is set out in the team.
- Reviewing and constructive feedback Review and give constructive feedback within 48 hours.
- Create well-written documented code to the agreed-upon style standards.
- Check code thoroughly prior to reviewing.
- Share equally in all the processes of the project (design, development, documentation, testing)

Collaboration and Respect

- Appreciate and listen to the views and ideas of all the team members.
- Be constructive, give feedback aimed at the work, not constructive criticism at the personal level.
- Be ready to be corrected and be ready to repeat on work.
- Share information and support struggling team members.
- Reward group and individual performance.
- Suppose that the intent in any team interaction is positive.

Project Management

- Keep task board updated on a regular basis (at least twice a week)
- Make commit code often containing commit messages that are clear and descriptive.
- Be more active in sprint planning and retrospectives.
- Indicate possible risks or problems immediately they are detected.
- Adhere to an agreed workflow and branching strategy of Git.

Meeting Guidelines

- Team meetings would be scheduled twice a week (once again, a schedule would be determined).
- Meetings will be initiated and terminated punctually.
- The meeting facilitator will be the team member who will be rotated on a weekly basis.
- Every member is supposed to have updates on their work.
- The meeting notes will be written and distributed within 24 hours.
- The decisions will be made when all agree, majority will vote when need be.

Resolution Process of Conflicts

The team will take the following escalation process when conflicts come about:

Step 1: Direct Communication

The members of a team that is experiencing a dispute will initially seek to solve the problem by engaging in a direct and honorable dialogue. Pay attention to the particular problem, but not to personal qualities.

Step 2: Team Mediation

In case the direct communication fails to fix the situation, take the issue to a team meeting during which everyone is able to discuss and assist to find a solution. The discussion will be done by a facilitator of the meeting.

Step 3: Instructor Participation.

And in the event that the conflict is not resolved following the team mediation, the team will then bond together by approaching the course instructor or teaching assistant to seek advice.

Addressing non-contribution

In case one of the team members fails to honor his or her promises:

- Initial incidence: Face to face discussion with the team member to learn about the obstacles and provide encouragement.
- Second occurrence: Team meeting, where the concerns are discussed and an improvement plan is established with certain milestones.
- Third incident: Report to the instructor who can present a report of the problems and possible solutions.

Decision Making

Significant project decisions (technology choice, architecture, scope change) have to be agreed upon by all members of the team. Majority vote by the team can be used to make minor decisions (code style, task assignment). When all is a stalemate, the team will record the two alternatives and consult the instructors.

Group Vision on Success

- Each team member will acquire and develop on this project.
- We will encourage the growth of one another and seek assistance where necessary.
- We shall provide a working application which will satisfy the project requirements.
- There will be a driven team culture in the project.
- We are going to self-reflect on our process and keep our cooperation on a constantly increasing level.

Team Agreement

All team members will guarantee adherence to this Code of Conduct and collaborate in order to make this team experience a successful and positive process by taking part in this project.
